Course Objective

Develop the capabilities required to design, implement, and manage data governance models in organizations, aligning data strategy with business objectives and digital transformation initiatives.

Learning Outcomes

- Understand the principles, frameworks, and core components of Data Governance.
- Design a data governance model aligned with organizational needs.
- Define policies for data quality, security, ownership, and information usage.
- Identify key roles such as Data Owner, Data Steward, and Data Custodian.
- Apply concepts of data architecture, including data lakes and data warehouses.
- Integrate data governance into broader digital transformation strategies.

Course Structure

Module 1: Introduction to Data Governance

Core concepts: data, information, and data value; why governance matters for decision-making; relationship with business strategy and digital transformation; real-world use cases.

Module 2: Data Governance Framework

Components of a governance model; roles and responsibilities; policies, standards, and processes; organizational culture and adoption.

Module 3: Data Quality and Information Management

Data quality dimensions; common problems and business impact; quality metrics and KPIs; continuous improvement strategies.

Module 4: Data Architecture for Governance

Data lakes, data warehouses, and data integration; ETL/ELT; data lineage; introduction to cloud data architectures with AWS.

Module 5: Security, Ethics, and Regulation

Privacy and data protection; information security practices; ethical use of data; general compliance considerations.

Module 6: Implementing Data Governance

Data maturity diagnosis; implementation roadmap; change management; practical cases and lessons learned.

Methodology

- Theory-practice sessions with an applied business perspective.
- Real-world case analysis, including telecom and other data-intensive sectors.
- Workshops to design governance models and define critical data elements.
- Discussion of organizational challenges around trust, quality, and decision-making.
- Practical orientation based on experience implementing analytics in business environments.

Assessment

Activity	Weight
Practical workshop: design of a data governance model	40%
Business case analysis	30%
Participation and class activities	30%

Final Applied Project

Design a data governance strategy for an organization, including current-state diagnosis, definition of roles and policies, proposed data architecture, data quality and information usage guidelines, and an implementation roadmap.

Differentiated Approach

The course integrates conceptual foundations with practical business experience, helping participants understand not only what data governance is, but how to implement it effectively in real organizations.
